

input

Create a function (or write a script in Shell) that takes an integer as an argument and returns "Even" for even numbers or "Odd" for odd numbers.

Function

output
(1545452), "Even")

1.function set to even_or_odd with parameter/argument of number*/

3. return a string of Even, even without it being a string does not work, string helps it apply to the test as a proper value. close with a semicolon

5.return a string of Odd, odd without it being a string does not work, string helps it apply to the test as a proper value. close with a semicolon

2. if number divided by modulus, a Arithmetic Operators that gives the remainder of the divided as a value, and the value in this case is equal to zero

4. the previous did not work, move on to the next line, else.
