

INPUT

reverses the string passed into it.

FUNCTION

OUTPUT

'world' => 'dlrow'

1. set function statement
to reverse with parameter/
argument s

2. /*return parameter s with method
split(), to split the string and
puts these substrings into an array; for
the parameter, only
quotes with no space, that way it will
pull each word in to an
array.....
then reverse() method which reverses
an array in place, the first
array element becomes the last and the
last array element becomes
the first .reverse holds nothing in the
parantheses....
then the join() method which creates
and returns a new string by
concatenating all of the elements in an
array.. set with parameter
with only quotations, no space, so it
joins the array in to a whole
string*/
